

# Industrial Triode Tubes

Svetlana triode tubes, for industrial processing, are ruggedly designed for the severe environment of manufacturing and production operations. A longer operating life than most Western tubes, results from the higher bakeout temperatures at which exhaust is performed, the improved quality of the ceramics used, and the mesh basket filament structure.

The Svetlana, uniquely colored, purple external ceramic has a smoother finish, is easier to clean, and is less likely to crack from misuse by inexperienced personnel.

Svetlana tube types are exact plug-compatible replacements for Western manufactured tube types of the same model.
